EDUCATION

University of Missouri

Columbia, MO

Bachelor of Engineering in Computer Science, Minor in Mathematics

Aug. 2023 – December 2026

– Certificate: Web and Mobile Applications Development

GPA: 3.95/4.00

EXPERIENCE

Garmin International

May 2026 – Aug. 2026

Software Engineering Intern

Olathe, KS

- **Cut large-report load time from 33s to 1.6s (~95% faster)** by restructuring SQL query patterns on a high-use ATE test-report platform; reduced yield queries **80%+** with a targeted step-name lookup.
- **Shipped a daily used batch comparison view** that pulls every socket in a batch into one side-by-side screen with a single click, replacing hours of manual serial-number lookups and cross-team back-and-forth.
- **Building an end-to-end PC provisioning tool** to standardize fresh-machine setup for every new product test: a normalized SQL Server schema, a PyQt5 management GUI, and a PowerShell/batch layer that silently installs and configures the full software stack.
- **Developed a driver for a Pickering thermocouple-simulation card**, configuring NI-VISA/NI-MAX and writing C against the vendor API to drive the hardware directly from automated test routines.

The Landing at Como

Aug. 2024 – May 2026

Community Assistant

Columbia, MO

- Drove outreach and lead-gathering that pushed the property to **100% occupancy for the first time in its history**, a ~30% year-over-year increase.

PROJECTS

Boeing Defense Flight Simulator | *Senior Capstone*

- Partnering with **Boeing Defense, Space & Security** on a 5-person capstone to deliver simulator-ready 3D models of three St. Louis-area airports for Boeing's pilot-training flight simulators.
- **Own the GIS modeling pipeline** (QGIS → BlenderGIS → Blender) against a formal client requirements document, meeting few-foot positional tolerances cross-verified across FAA, OSM, and satellite sources.

FaultInjector | *.NET 10, C#, ASP.NET Core, Docker*

- Built a **Dockerized reverse proxy** with custom ASP.NET Core middleware that injects controlled latency, errors, and timeouts into API traffic to validate downstream service resilience.
- Designed a **control-plane REST API** to view, replace, and toggle fault rules at runtime, enabling live experiments without restarting the service.

Homelab | *Raspberry Pi 5, Linux, Docker, Tailscale*

- **Built and self-host a headless Linux homelab on a Raspberry Pi 5**, running multiple services in Docker containers (managed via Docker Compose) for clean isolation and reproducible, version-controlled configuration.
- **Exposed services securely over HTTPS** via a reverse proxy on a registered domain (ailuruslab.dev) with TLS, plus remote access through Tailscale, hardened SSH (key-based auth), and a host firewall limiting inbound traffic to required ports.

TigerPath | *Next.js, React, Python*

- Built a **Mizzou course-information web app** (Next.js) that surfaces course details and professor information side by side, letting students evaluate the classes and instructors they'll take in one place instead of digging across multiple sites.
- Wrote **Python scrapers** that pull and merge data from the course catalog and RateMyProfessor, normalizing it into static JSON served client-side (localStorage) to keep the app free to host and free of backend or data-liability concerns.

TECHNICAL SKILLS

Languages: Python, C#, C++, C, JavaScript, TypeScript, SQL

Frameworks & Libraries: React, Next.js, Node.js, Express, FastAPI, ASP.NET Core, PyQt5, Selenium

Developer Tools: Docker, Git, Linux, PostgreSQL, SQL Server, MongoDB, Supabase
